

Commercial Sheet Vinyl Heat Welding Gun Urethane Tips

GENERAL INFORMATION

Mannington Commercial manufactures multiple Commercial Sheet Vinyl Products that can be Heat Welded together at the seams. The Heat Welding Process is unique and requires multiple steps, but when done correctly allows for an exceptionally beautiful space and finished installation.

Historically, Mannington has recommended that a PVC Heat Welding Tip be used on the end of the Heat Welding gun.

We now recommend **only** using a **Urethane Tip** when heat welding Mannington Commercial Sheet Vinyl Products. Urethane tips regulate the air flow of the heat, from the end of the heat welding gun, at a consistent temperature allowing the weld rod to be melted directly into the groove and reduce the potential for "burning" the seams. This consistent temperature is required when melting both the sheet vinyl and weld rod together during the installation process as this creates the strong bond. High quality Urethane Tips can be purchased at locations such as: Turbo Heat Welding Tools (turboheatweldingtools.com) and Winkelman Sales (winkelman-sales.com).
